

1. Assuming the five states diagram for a process, a process is _____ when the process has enough memory allocated, but is not allocated in the CPU.

ready

2. Check all adjectives that apply to a process

active

dynamic

3. Assuming the five states diagram for a process, a process is _____ when the process has enough memory allocated and the CPU as well.

running

4. The program will transform into a process after _____.

it is launched

5. Assuming the five states diagram for a process, a process is _____ right after it initiates an I/O request/operation.

waiting/blocked

6. Check all that apply to performance of batch systems:

higher throughput (Jobs performed/time) than time-sharing systems

7. For a process in general, the _____ size varies while _____ size does not.

stack

data

8. Assuming the five states diagram for a process, the process is _____ when the process does not yet have any resource.

new

9. For a process in general, the _____ size varies while the _____ size does not.

heap

code

10. A process is a program.

false

11. Check all that a process has and the program does not.

stack

heap

process control block

12. Check all that apply to performance of Time-shared systems:

has a lower throughput than batch system

small response time

interactive system

13. Assuming the five states diagram for a process, a process P is _____ right after all I/O request/operations are completed for P.

ready

14. Check all adjectives that apply to a program

passive
dead

15. A process is a program in execution.

True

16. Check all that a program and a process share in common.
