

1. This scheduler is involved when a process initiates an I/O operation.
None of these answers
2. Suppose that no process is in the ready queue and the CPU is available. From which queue should the CPU scheduler select the next process to run/execute?
None of these answers
3. This scheduler ponders whether there is enough memory for the processes already admitted in the system.
medium-term scheduler
4. We want to sort the different schedulers from the most to the least frequently invoked by the operating system. The most frequent must be assigned 1.
Admission/Job scheduler - 3
Memory scheduler - 2
CPU scheduler - 1
5. Match the queues to the processes in them
job queue - processes just admitted in the system
ready queue - processes waiting on the CPU to execute
waiting/blocked queue - processes that just initiated an I/O operation
suspended ready queue - processes waiting on the CPU and memory to execute
suspended waiting/blocked queue - processes waiting on memory and I/O operations to complete
6. This scheduler is involved when a process must be kicked out from the CPU.
short-term scheduler
7. In the context of process management, match the schedulers.
Admission/Job scheduler - Long-term scheduler
Memory scheduler - medium-term scheduler
CPU scheduler - short-term scheduler
8. The long-term scheduler moves processes between the _____ queue and the _____ queue.
job
ready
9. The short-term scheduler moves processes between the _____ queue and the _____ queue.
On-CPU (running)
ready
10. Check all that apply to CPU-bound processes
use very few I/O operations
have some very long CPU bursts
11. The medium-term scheduler moves processes between the _____ queue and the _____ queue.
waiting/blocked
suspended waiting/blocked

12. Check all schedulers that may be invoked right after a process terminates.
medium-term scheduler
short-term scheduler
13. This scheduler is involved when an I/O operation is completed.
None of these answers
14. This scheduler controls the degree of multiprogramming.
long-term scheduler
15. This scheduler is involved when a new process must be admitted in the system.
long-term scheduler
16. Check all that apply to I/O-bound processes
have short CPU bursts
perform more I/O operations than computations
