

1. Three children are playing. The only available toys are a pony and a gun. John loves using only the pony to play. Amy prefers the gun only. Paul already grabbed the pony and the gun and is playing. Do we have a deadlock?

False

2. "Hold and Wait" and circular wait are interchangeable conditions: if you have one, you automatically get the other

False

3. Consider an operating system that forces processes to release all its held resources if its latest request is denied. Which strategy does this operating system adopt?

Deadlock Prevention

4. Consider an operating system that forces processes to request resources from the least expensive to the most expensive ones. In this case, which necessary condition(s) is/are directly neutralized?

Circular Wait

5. Consider an operating system that allows processes to request one resource one at a time as long as they release any resource they may have. In this case, which necessary condition(s) are neutralized?

Hold and Wait

6. In a system, each type of resources have infinite instances. In this case, which necessary condition(s) would be directly "neutralized"?

Mutual Exclusion

Hold and Wait

7. Consider an operating system that forces processes to release all its held resources if its latest request is denied. In this case, which necessary conditions are directly neutralized?

No preemption

Hold and Wait

8. Consider an operating system that requires from all applications to request in advance all the resources (printer, disks, memory space...) they would need throughout their execution. These resources are then reserved to be allocated on the spot whenever the process requests them. Which strategy does this operating system adopt?

Deadlock Prevention

9. Consider an operating system that forces processes to request resources from the least expensive to the most expensive ones. Which strategy does this operating system adopt?

Deadlock Prevention

10. Consider an operating system that requires from all applications to request in advance all the resources (printer, disks, memory space...) they would need throughout their execution. These resources are then reserved to be allocated on the spot whenever the process requests them. In this case, which necessary conditions are directly neutralized?

Hold and Wait
