

1. Select on the dropdown menu whether a policy will in general incur internal or external fragmentation.

Yes
No
No
Yes

2. A system uses contiguous allocation with equal fixed partitions. As seen on the picture, the operating system can assign fixed partitions B, D, F. When Process 11 arrives, these issues/solutions will be raised or needed.

internal fragmentation

3. A driver wants to park along a street with no assigned/marked spots. We assume that he has a huge truck with solid bumper guards. Furthermore, he is drunk and ruthless. Check all that apply.

If there is enough available, but scattered space he may use a technique similar to memory compaction.

He will use contiguous placement

He will be using variable partition allocation

He may experience external fragmentation

4. Memory compaction is expensive because

It eventually moves a lot of data from memory to memory

It must use the CPU to select the right processes to move

It must be often used

5. In order to eliminate external fragmentation, the operating system divides the process in equal sized pieces that it can scatter in the physical space. The equal sized pieces (host) in the physical space are called _____.

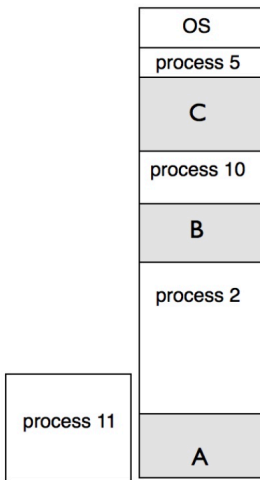

frames

6. In order to totally eliminate external fragmentation, _____.

the OS could fragment the processes and place them in slots not necessarily contiguous

7. A system uses contiguous allocation with variable partitions and first-fit policy. As seen on the picture, Process 11 arrives and needs memory. Scanning bottom to up, the operating system will search for a slot. The operating system will assign _____ slot. Otherwise, it may consider

_____ and move Process _____.

no
memory compaction
process 5 right below Process 10

8. A driver wants to park along a street with walled spots. We assume that he has a compact car. Furthermore, he is sober and takes care of his car. Check all that apply.

He will be using equal size fixed partitions allocation

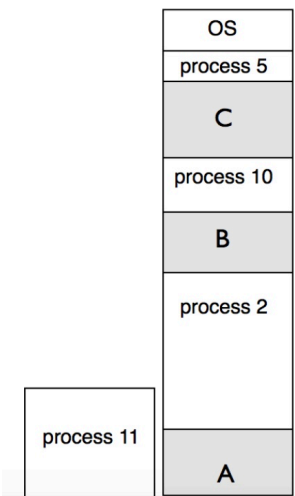

He may experience internal fragmentation

He will use contiguous placement

9. In order to eliminate external fragmentation, the operating system divides the process in equal sized pieces that it can scatter in the physical space. The equal sized pieces in the logical space are called _____.

pages

10. A system uses contiguous allocation with variable partitions and first-fit policy. As seen on the picture, Process 11 arrives and needs memory. Scanning bottom to up, the operating system will search for a slot. It seems that these issues/solutions will be raised or needed.

memory compaction
external fragmentation
